

SURVEILLINT™ FOR CORPORATE SECURITY

Stricter compliance regulations and internal mandates are pressuring today's Chief Security Officers (CSOs) to implement effective and efficient solutions that mitigate risk and protect global assets. Security personnel are overwhelmed with information from many disparate systems resulting in slower response to incidents, inefficient use of resources and increased security risk. Problems intensify as organizations implement and integrate other technologies such as IT, communication and building management systems. Because budgets continue to be difficult to obtain, calculating a realistic return on investment (ROI) is often required for support and approval of PSIM projects.

Surveillint

As the premier solution to manage situations and resolve incidents, Surveillint offers advanced features that help security operators assess and resolve incidents quickly.

- **Mitigate risk across the organization.** Surveillint integrates new and existing security systems into a common platform. It connects disparate information to mitigate risk across the enterprise environment by providing actionable intelligence and speeding security incident resolution.
- **Enforce compliance regulations and corporate policies.** Surveillint provides greater visibility of all security activity in a real-time single view while its Business Logic Manager helps organizations implement and enforce policies. Surveillint monitors the health of security devices to report problems before an incident occurs. It also generates the necessary reports for compliance requirements.
- **Generate a Quick Return on Investment (ROI).** Calculating ROI is often a daunting task but is required to justify expenditures. The Proximex™ ROI model helps organizations calculate a realistic Surveillint implementation ROI based on a broad set of quantitative and qualitative benefits. Benefits include: eliminate "rip and replace" and custom integration; reduce cost of false alarms and financial lost from incidents; and decrease training costs.

Key Benefits

- Improve visibility across the security environment
- Speed incident response
- Enforce corporate and regulatory policies and procedures
- Monitor the health of security infrastructure
- Generate a quick return on security investment

KEY CAPABILITIES

Centralized View of Security Activity

Surveillint provides centralized command and control and offers a single view of all security activity.

- Work within an easy-to-use and intuitive interface
- Manage and prioritize alerts based on templates and policies and procedures
- Watch live and recorded video, snap images and export video
- Attach relevant documents, links and images to incident notes
- Use advanced PTZ camera controls, including USB joystick support
- Deploy alerts to officers in the field
- Monitor security system health

Business Logic Manager

With Business Logic Manager, organizations can now effortlessly enforce corporate and regulatory policies and procedures so operators can focus on resolving the incident at hand.

- View a graphical, Visio-like interface designed for the business user
- Eliminate the need for complicated coding
- Symbolize multi-layered policies in a handful of steps instead of thousands of rules
- Operate with drag and drop reusable activities to design, test and maintain business logic

- Define and automate tedious tasks and capture expert knowledge
- Manage response tasks related to required actions (workflow)

Incident Connection Engine

Surveillint connects and correlates incidents with related information from disparate security systems to reduce the number of false alarms and insignificant incidents.

- Connect incidents with related information
- Correlate related incidents to further reduce false alarms

Flexible Reporting

Surveillint provides automated, yet configurable, reporting.

- Develop incident and subject tracking reports
- Generate trend and compliance reports
- Eliminate laborious hours generating reports by hand or verifying accuracy

PocketSurveillint™

PocketSurveillint is a mobile web app that eliminates miscommunication and the need to translate incident information verbally to officers in the field.

- Notify first responders with speed and accuracy
- Facilitate two-way communication between the security office and field officers

GIS Visualization

GIS integration with Surveillint leverages the power of GPS map details so security personnel can better visualize security zones and track resources.

- Drill down through maps and display security resources
- Track location of field officers or other location-based services via GPS

Open Platform for Integration

Surveillint is an open and flexible platform for commercial, off-the-shelf integration. With its service oriented architecture (SOA) design, Surveillint scales to support thousands of sensors and virtually any security system including video, access control, intrusion, biometrics, and even HR and building management.

- Integrate with virtually any security or security-related system
- Communicate bi-directionally with systems
