

SURVEILLINT™ FOR FEDERAL CIVILIAN & DEFENSE AGENCIES

In what can be viewed as “the perfect storm,” security officials within federal civilian and defense agencies are being challenged by managing daily threats, enforcing security operating procedures and consolidating operations. Together, these challenges are prompting agencies to find new ways to protect and secure sensitive assets and facilities. Improved systems and technologies are emerging for better security, but the systems are siloed and information difficult or unable to be communicated, so security teams must monitor several systems at the same time. As a result, resolving incidents has become ineffective and time consuming.

Surveillint

As the premier solution to manage situations and resolve incidents, Surveillint offers a centralized view of all security activity with advanced features that help operators assess and resolve incidents quickly.

- **Mitigate risk across the security environment.** Surveillint integrates new and existing security systems into a common platform. It connects disparate information to mitigate risk across the security environment by providing actionable intelligence and speeding security incident resolution.
- **Enforce event response processes.** Surveillint provides greater visibility of all security activity in a real-time single view while its Business Logic Manager helps federal civilian and defense agency personnel implement and enforce standard operating procedure.
- **Reduce security operations costs.** Integrating existing systems with new technologies into a centralized command and control center is one of Surveillint’s greatest strengths. This integration allows organizations to leverage current investments, eliminate custom integration and reduce the cost of false alarms. It also decreases financial loss from incidents and training costs.

Key Benefits

- Examine all security activity in a single view
- Speed incident response time
- Boost suspect apprehension rate
- Build stronger investigation cases
- Communicate easily and clearly with internal and external resources
- Leverage existing systems and other investments

KEY CAPABILITIES

Centralized View of Security Activity

Surveillint provides centralized command and control and offers a single view of all security activity.

- Work within an easy-to-use and intuitive interface
- Manage and prioritize alerts based on standard operating procedure
- Watch live and recorded video, snap images and export video
- Attach relevant documents, links and images to incident notes
- Use advanced PTZ camera controls, including USB joystick support
- Deploy alerts to officers in the field
- Monitor security system health

Business Logic Manager

With Business Logic Manager, federal civilian and defense agency personnel can effortlessly enforce standard operating procedures which allow operators to focus on resolving the incident at hand.

- View a graphical, Visio-like interface designed for any user
- Eliminate the need for complicated coding
- Symbolize multi-layered policies in a handful of steps instead of thousands of rules
- Operate with drag and drop reusable activities to design, test and maintain business logic
- Define and automate tedious tasks and capture expert knowledge
- Manage response tasks related to required actions (workflow)

EZ Track™

EZ Track makes tracking subjects across multiple camera views as easy as the click of an arrow. Operators can trail subjects without memorizing camera IDs and locations or manually searching recorded video clips.

- Follow subjects across multiple camera views with ease
- Track subjects backwards through recorded video or catch up with them in real time
- Monitor multiple camera views in tandem
- Snap video images and export video
- Quickly generate subject tracking reports

Incident Connection Engine

Surveillint connects and correlates incidents with related information from disparate security systems to reduce the number of false alarms and insignificant incidents.

- Connect incidents with related information
- Correlate related incidents to further reduce false alarms

Flexible Reporting

Surveillint provides automated, yet configurable, reporting.

- Develop incident and subject tracking reports
- Generate trend reports
- Eliminate laborious hours generating reports by hand or verifying accuracy

PocketSurveillint™

PocketSurveillint is a mobile web app that eliminates miscommunication and the need to translate incident information verbally to officers in the field.

- Notify first responders with speed and accuracy
- Facilitate two-way communication between the security office and field officers

GIS Visualization

GIS integration with Surveillint leverages the power of GPS map details so security personnel can better visualize security zones and track resources.

- Drill down through maps and display security resources
- Track location of field officers or other location-based services via GPS

Open Platform for Integration

Surveillint is an open and flexible platform for commercial, off-the-shelf integration. With its service oriented architecture (SOA) design, Surveillint scales to support thousands of sensors and virtually any security system including video, access control, intrusion, biometrics, and even HR and building management.

- Integrate with virtually any security or security-related system
- Communicate bi-directionally with systems
